Combined reflectance confocal microscopy-optical coherence tomography for delineation of basal cell carcinoma margins: an ex vivo study.

ABSTRACT

We present a combined reflectance confocal microscopy (RCM) and optical coherence tomography (OCT) approach, integrated within a single optical layout, for diagnosis of basal cell carcinomas (BCCs) and delineation of margins. While RCM imaging detects BCC presence (diagnoses) and its lateral spreading (margins) with measured resolution of $\leq 1 \text{?m}$, OCT imaging delineates BCC depth spreading (margins) with resolution of $\leq 7 \text{?m}$. When delineating margins in 20 specimens of superficial and nodular BCCs, depth could be reliably determined down to $\leq 600 \text{?m}$, and agreement with histology was within about $\leq 50 \text{?m}$.
